1. **Removal:** Remove the gear shift knob and transfer case shift knob by twisting them counter clockwise.

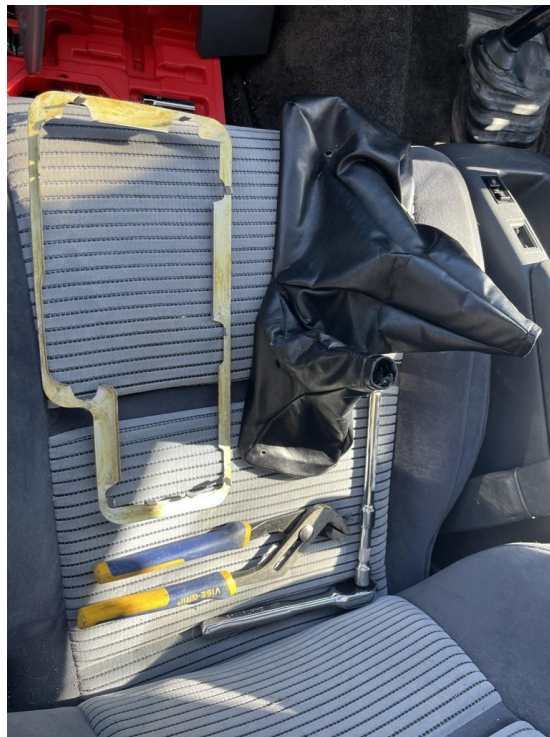

2. Remove the four phillips head screws securing the console. There are two on each side. Lift the console over the shift levers to remove.

3. Flip the console over and use pliers to twist the metal tabs to separate the shift boots from the console. Once separated, peel the shift boots off the metal frame.

4. Begin by fitting the product over top of the frame and folding the material to align the notches of the shift boots with the tabs on the frame. Secure with clips to maintain alignment. For this project I chose to use Gorilla Glue Extended Dry Time Hot Glue to secure the shift boots to the frame, however if you require more working time it is recommended to use an alternative automotive adhesive. Systematically work around the frame gluing the material to the underside of the metal. **Assure that the stitched seams align with the corners of the frame.**

5. Once the shift boot is reattached to the metal frame insert the tabs into the console. Twist / Crimp the tabs to secure the boot assembly to the console. **If a longer dry time adhesive was used, allow the adhesive to cure slightly until the shift boots are firmly stuck to the frame then reattach the frame to the console. Once reattached the pressure will allow the adhesive to fully cure to a strong bond.**

6. Return the console to the vehicle and place it over the shift levers. Resecure the console with the four Phillips screws. Screw the gear shifter and transfer case knobs back on.

**Congratulations – and enjoy your new shift boot from RedlineGoods!**

**Useful tip**

Make sure to condition your new shift boot properly, using the proper care products for the material you've chosen for your shift boot (leather and Alcantara require different treatments) and you'll enjoy it for years!
